HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

A reconstruction of
Bojko's table of quarter-squares
(1909)

Denis Roegel

2013

(last version: 6 november 2013)

1 The method of quarter-squares

The method of quarter-squares is a multiplication method which makes use of the identity

$$ab = \frac{1}{4} \left((a + b)^2 - (a - b)^2 \right).$$

If we possess a table of squares, and wish to compute the product ab , it is then sufficient to compute $a + b$, $a - b$, to look up the table for these two values, to subtract the values read in the table, and to divide the result by 4. This seems complex, but for large numbers it is more efficient than to compute directly the product.¹

There have been a number of tables of squares around, in particular those of Ludolf published in 1690 [35], and those published by Séguin in 1801 and giving the squares up to 10000. But these authors did mostly not have multiplications in mind, although Ludolf showed how squares could be used to compute a multiplication. At the beginning of the 19th century, the method of quarter-squares was mentioned in passing by Laplace in 1809 [14, p. 261] and Gergonne in 1816 [17, pp. 159–160], but they did not produce tables.

2 The first tables of quarter-squares (1817)

In 1817, Voisin [55] and Bürger [9] published independently the first tables of quarter-squares. Voisin and Bürger both understood that a table of squares could be useful for multiplications, but they went one step beyond, and removed the need to divide the difference of the squares by 4. Their tables gave the quarter-squares for all integers up to 19999 (Bürger) and 20000 (Voisin).

More exactly, when a number is odd, its quarter-square is of the form $n + 0.25$ and Voisin and Bürger only gave the value n . So if a and b are both odd or both even, the values of the quarter-squares are given exactly. If one of the integers is odd and the other is even, both quarter-squares are in default by 0.25, but the difference of these two values is correct. So, although the tables of Voisin and Bürger are not totally accurate for a table of squares, they serve the purpose of a table of multiplication. If one wished to use them as a table of squares, one would need to remember to add 1 to the result multiplied by 4, whenever the value entered is odd.

A table of quarter-squares is also very advantageous with respect to space. Such a table is a linear table, with only one entry. With slightly more work than a mere table of multiplication, it is possible with a table of quarter-squares to do computations that would require many thousands of pages with a conventional table of multiplication, such as Crelle's table [12].

In 1820, in the second edition of his *Philosophy of arithmetic* [34, pp. 246–257], John Leslie described tables of quarter-squares, and in particular Voisin's table, of which he gave an excerpt up to 2000. Leslie expressed the hope that someone would compute a table up to 200000.

¹For a survey of the quarter-square method, see the articles by McFarland [37, 36] and Weiss [56].

| Table | Range | Pages | Density |
|----------------------|--------|-------|---------|
| Voisin (1817) | 20000 | 123 | 162.6 |
| Bürger (1817) | 20000 | 80 | 250.0 |
| Centnerschwer (1825) | 20000 | 40 | 500.0 |
| Merpaut (1832) | 40000 | 400 | 100.0 |
| Kulik (1851) | 30000 | 40 | 750.0 |
| Laundy (1856) | 100000 | 200 | 500.0 |
| Blater (1887) | 200000 | 200 | 1000.0 |
| Bojko (1909) | 20000 | 20 | 1000.0 |
| Plassmann (1933) | 20009 | 200 | 100.0 |

Table 1: A comparison of the main tables of quarter-squares. The density is the ratio of the range by the number of pages. The tables which pack the greatest ranges in the smallest number of pages are those of Blater and Bojko.

3 Later tables of quarter-squares

A number of other tables of quarter-squares were published during the 19th century (table 1). Centnerschwer [10] published a table of quarter-squares up to 20000 in 1825, Kulik in 1833 and 1851 (up to 30000) [27, 28], Merpaut in 1832 (up to 40000) [38], Laundy in 1856 [32], and Blater in 1887 [1]. Laundy’s table gave the quarter-squares up to 100000, whereas Blater extended it to 200000. In 1836, Galbraith published a small table of quarter-squares in a more general collection of tables [16]. This table was probably borrowed from Voisin’s table.

In the preface of his table of quarter-squares [32, p. iv], Laundy also mentions that Peter Gray had in his possession a manuscript of a table of quarter-squares extending to 200000 by Shortrede, but that table was never published.

There have also been several applications of quarter-squares for mechanical aids. In 1829, Schiereck invented a calculating machine based on quarter-squares [57] and in 1841 he devised an instrument for the measurement of the area of triangles, useful in surveying, and also based on quarter-squares [52, 24].

In a book published in 1857, Edward Sang also suggested the use of quarter-squares for multiplications [11, pp. 50–51].

The use of quarter-squares declined in the first half of the 20th century [37], but Bojko in 1909 [5] and Plassmann in 1933 [40] each published tables of quarter-squares up to 20000. In the 1950s, however, new applications of the quarter-squares method for multiplication on analog devices surfaced, and this prompted their use for the implementation of multiplication in digital processors [25, 26].

Finally, we mention that tables of triangular numbers can also be used in a way similar to quarter-squares in order to facilitate the multiplications [13].

4 Bojko

Josef Bojko (1881– 19??) was an engineer from Novoselytsia, formerly in Russia and now in Ukraine. He defended his PhD² in Zurich in 1908 and published his dissertation on a new table of quarter-squares in 1909 [5, 4, 58].

He also published books on practical or mental calculation in 1907 and 1920 [8, 6], several articles on mathematics [3, 2], as well as on the wiring of electrical motors [7].

5 Structure of Bojko’s table and reconstruction

Bojko’s table of quarter-squares is very compact and gives the quarter-squares of all integers from 0 to 20000 on only 20 pages. When looking for the quarter-square of a number x , this number is split in two parts $x = N|n$, where n are the last two digits. For instance, $x = 5134$ is split into $N = 51$ and $n = 34$. Each double page of Bojko’s table covers a range of values of N and n . The left-hand pages cover even values $0 \leq N \leq 98$, as well as odd values $101 \leq N \leq 199$. The right-hand pages cover odd values of $1 \leq N \leq 99$, as well as even values $100 \leq N \leq 198$. There are 10 values of n on each page, but these values depend on whether $N > 99$ or $N < 100$. When $N > 99$, Bojko calls the prefix N_1 and the suffix n_1 , so that on the first double page $0 \leq n \leq 9$ and $100 \geq n_1 \geq 91$, on the second double page $10 \leq n \leq 19$ and $90 \geq n_1 \geq 81$, on the third double page $20 \leq n \leq 29$ and $80 \geq n_1 \geq 71$, . . . , and on the last double page $90 \leq n \leq 99$ and $10 \geq n_1 \geq 1$.

The value of the quarter-square of $N|n$ (or $N_1|n_1$) is split in three parts $A|B|C$ (or $A_1|B_1|C$). For instance, the quarter-square of 5134 is 65|894|89, where A is found at the intersection of column A and line 51, B is found at the intersection of line 51 and column 34 (read at the top), and C is found at the bottom of column 34 (read at the top). The intersection of line 51 and column 34 actually gives “**4** 894”, which should be read “894,” the bold digit being ignored.

The quarter-square of 14864 is 552|346|24, where A_1 is found at the intersection of column A_1 and line 148, B_1 is found at the intersection of line 148 and column 64 (read at the bottom), and C is found at the bottom of column 64 (read at the bottom). The intersection of line 148 and column 64 actually gives “**3** 946”, which should be read “346,” this time the bold digit being used, because $N > 99$. Each cell contains two values which share the same last two digits. That this is possible is shown below.

A number of entries of Bojko’s table contain asterisks. For instance, at the intersection of line 61 and column 32 (read at the top), the value given is “**8*** 003.” Such an asterisk then also appears on all the values towards the right of the same line. The values immediately to the left are “**9** 942” and “**8** 972.” The value of B has actually overflowed, so that the value of A must be incremented. The quarter-square of 6132 is therefore 94|003|56 and not 93|003|56.

Asterisks may also precede bold digits, in which case they signify an overflow for values of B_1 . For instance, at the intersection of line 144 and column 67 (read at the bottom), we have the value “***2** 535”, so that the quarter-square of 14467 is 523|235|22 and not 522|235|22.

²He was registered under number 17028 in 1906 and left the University of Zurich on 23 November 1908, see <http://www.matrikel.uzh.ch/active/static/2740.htm>.

Left-hand pages give the quarter-squares of $200p+n$, where $0 \leq p \leq 49$. Let us denote $q(x)$ the quarter-square of x . Then, $q(200p+n) = \frac{40000p^2+n^2+400pn}{4} = 10000p^2+100pn+\frac{n^2}{4}$. In other words, the last two digits of $q(x)$ are the last two digits of $\frac{n^2}{4}$, which explains that C is a value common to a whole column. Similarly, right-hand pages give the quarter-squares of $200p+100+n$ for $0 \leq p \leq 49$ and the last two digits of the quarter-square are those of $\frac{n^2+200n}{4}$. In addition, left-hand pages give the quarter-squares of $x = 200p+100+(100-n)$ for $50 \leq p \leq 99$, and $q(x) = \frac{40000(p+1)^2+n^2-400(p+1)n}{4}$ whose last two digits are the same as those of the quarter-square of $200p+n$. Similarly, right-hand pages also give the quarter-squares of $x = 200p+(100-n)$ for $50 \leq p \leq 99$, and the last two digits of the quarter-squares are those of $\frac{n^2-200n}{4}$, whose last two digits are identical to those of $\frac{n^2+200n}{4}$.

All that remains to be shown is that the last two digits of B are identical to the last two digits of B_1 for overlapping cells. In other words, on left-hand pages, $x_1 = 200p+n$ is shared with $x_2 = 100(199-2p)+(100-n) = 20000-200p-n = 20000-x_1$. On right-hand pages, $x_1 = 100(2p+1)+n$ is shared with $x_2 = 100(198-2p)+(100-n) = 20000-200p-100-n = 20000-x_1$. Consequently, $q(x_2) = \frac{20000^2+x_1^2-40000x_1}{4} = 10000z + q(x_1)$ where z is some integer. Therefore, the quarter-squares of x_1 and of x_2 have the same last four digits.

Bojko's table may contain a few errors. For instance, on the first page of the table, the second column to the right contains 939 when it should actually be 940. Therefore, when computing the quarter-square of 19391, Bojko returns 939|027|20, instead of the correct 940|027|20.

References

The following list covers the most important references³ related to Bojko's table. Not all items of this list are mentioned in the text, and the sources which have not been seen are marked so. We have added notes about the contents of the articles in certain cases.

³**Note on the titles of the works:** Original titles come with many idiosyncrasies and features (line splitting, size, fonts, etc.) which can often not be reproduced in a list of references. It has therefore seemed pointless to capitalize works according to conventions which not only have no relation with the original work, but also do not restore the title entirely. In the following list of references, most title words (except in German) will therefore be left uncapitalized. The names of the authors have also been homogenized and initials expanded, as much as possible.

The reader should keep in mind that this list is not meant as a facsimile of the original works. The original style information could no doubt have been added as a note, but we have not done it here.
