HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

Formal verification of tricky numerical computations

Keywords: Floating-point, formal proof, deductive verification

Computer arithmetic has applied formal methods and formal proofs for years. As the systems may be critical and as the properties may be complex to prove (many sub-cases, error-prone computations), a formal guarantee of correctness is a wish that can now be fulfilled.

This talk will present a chain of tools to formally verify numerical programs. The idea is to precisely specify what the program requires and ensures. Then, using deductive verification, the tools produce proof obligation that may be proved either automatically or interactively in order to guarantee the correctness of the specifications. Many examples of programs from the literature will be specified and formally verified.
