HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

* Published article: Colmant (M.), Kurpicz (M.), Huertas (L.), Rouvoy (R.), Felber (P.) et Sobe (A.). – Process-level Power Estimation in VM-based Systems. – In *European Conference on Computer Systems (EuroSys)*, Bordeaux, France, avril 2015

Motivation

Problem

- Hard to identify the largest power consumers
- Power meters are not fine-grained enough
- Limited number of processor-agnostic solutions
- Limited number of power-aware interfaces

Vision

- Software-defined power meters
- Support for all CPU features
- Provide critical indicators

Metrics

Hardware (HW) Performance Counters

- Representative and accurate metrics
- Mostly available on modern processors

Criteria selection

- Counter availability per CPU
- Monitoring overhead
- Best fit under several workloads

Selected HW Performance Counters

- CPU_CLK_UNHALTED:THREAD_P (*uc*)
- CPU_CLK_UNHALTED:REF_P

PowerAPI

Implementation

Available online:
<http://powerapi.org>

Learn the CPU power model

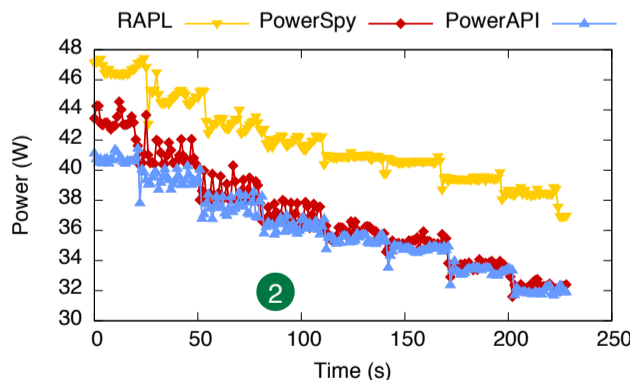

Power Model

$$P_{host}(f) = P_{idle}(f) + \sum_{pid \in PIDs} P_{cpu}(f, uc_{pid}^1 \dots uc_{pid}^N)$$

$$P_{cpu}(f, uc_{pid}^1 \dots uc_{pid}^N) = \sum_{n=1}^N P_f(uc_{pid}^n)$$

Validation

- 1 Process-level power consumption of PowerAPI, x264, and freqmine on a Xeon W3520 processor
- 2 Decreasing load of stress on a i3 2120 processor, compared to RAPL
- 3 Relative error distribution of the PARSEC benchmarks on a Xeon W3520 processor
- 4 Power models for the highest frequencies on a Xeon W3520 processor
