**HAL** is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

## **Abstract**

For the reasons of flexibility and availability, the data may be stored in the cloud. However security of sensitive data and the reliability of access of data are two major issues that become immediate concern. Trust on the services for the secure upkeep of data, its regular maintenance and mechanisms for seamless access are other issues related to such organization of data.

In this talk, we present an encrypting file system based on GNU/Linux based servers which can be accessed through standard protocols such as NFS over unsecured networks. At the same time, the data stored in the servers is always in encrypted form. With only a suitable key management protocol and access control mechanisms, it is ensured that data is made available only to right entities. In the trusted domain for the files, even the system administrators are not included which makes it highly robust yet providing mechanisms for routine administrative jobs such as backup, restoration, duplication and other similar functions on data.

We also present a few more applications for this same file system, such as the case where data on a portable device such as laptop can be protected against loss of information in case of thefts etc.
