HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

Preface

IFIP Working Group 10.2 is pleased to sponsor DIPES 2010, the IFIP Conference on Distributed and Parallel Embedded Systems. The conference was held in Brisbane, Australia on September 20-22, 2010 as part of the IFIP World Computer Conference.

Already when establishing this conference series in 1998, the idea of distribution, where the control task is carried out by a number of controllers distributed over the entire system and connected by some interconnect network was emphasized in its title. This idea naturally leads to the recent research field of cyber physical systems where embedded systems are no longer seen as “closed boxes” that do not expose the computing capability to the outside. Instead networked embedded systems interact with physical processes in a feedback loop leading to ever more “intelligent” applications with increased adaptability, autonomy, efficiency, functionality, reliability, safety, and usability. Examples, like collision avoidance, nano-tolerance manufacturing, autonomous systems for search and rescue, zero-net energy buildings, assistive technologies and ubiquitous health-care, cover a wide range of domains influencing nearly all parts of our lives.

Hence, the design of distributed embedded systems interacting with physical processes is becoming ever more challenging and ever more needs interdisciplinary research of designers and researchers from industry and academia. DIPES provides an excellent forum for discussing recent research activities and results.

DIPES 2010 received 37 submissions: 30 from Europe, 4 from South America, 2 from Asia/Australia, and 1 from Africa. From these submissions, the program committee accepted 18 papers for presentation at the conference. The contributions present advanced design methods for distributed embedded systems, starting from specification and modelling over verification and validation to scheduling, partitioning and code generation, also targeting specific architectures like upcoming multi-core systems or reconfigurable systems.

We would like to thank all authors for their submitted papers and the program committee for their careful review. Our thanks also go to Rolf Ernst for his inspiring keynote speech on mastering the conflicting trends safety, efficiency and autonomy in embedded systems design. We gratefully acknowledge the superb organization of this event by the WCC committee. Furthermore, we also thank our colleague Claudius Stern for his valuable support in preparing the camera ready material for this book.

Marilyn Wolf, Bernd Kleinjohann and Lisa Kleinjohann
