*Marco Winckler, University Paul Sabatier, Toulouse, France*

TC 14 – Entertainment Computing

*Matthias Rauterberg, Eindhoven University of Technology, The Netherlands*

## **IFIP – The International Federation for Information Processing**

IFIP was founded in 1960 under the auspices of UNESCO, following the first World Computer Congress held in Paris the previous year. A federation for societies working in information processing, IFIP's aim is two-fold: to support information processing in the countries of its members and to encourage technology transfer to developing nations. As its mission statement clearly states:

*IFIP is the global non-profit federation of societies of ICT professionals that aims at achieving a worldwide professional and socially responsible development and application of information and communication technologies.*

IFIP is a non-profit-making organization, run almost solely by 2500 volunteers. It operates through a number of technical committees and working groups, which organize events and publications. IFIP's events range from large international open conferences to working conferences and local seminars.

The flagship event is the IFIP World Computer Congress, at which both invited and contributed papers are presented. Contributed papers are rigorously refereed and the rejection rate is high.

As with the Congress, participation in the open conferences is open to all and papers may be invited or submitted. Again, submitted papers are stringently refereed.

The working conferences are structured differently. They are usually run by a working group and attendance is generally smaller and occasionally by invitation only. Their purpose is to create an atmosphere conducive to innovation and development. Refereeing is also rigorous and papers are subjected to extensive group discussion.

Publications arising from IFIP events vary. The papers presented at the IFIP World Computer Congress and at open conferences are published as conference proceedings, while the results of the working conferences are often published as collections of selected and edited papers.

IFIP distinguishes three types of institutional membership: Country Representative Members, Members at Large, and Associate Members. The type of organization that can apply for membership is a wide variety and includes national or international societies of individual computer scientists/ICT professionals, associations or federations of such societies, government institutions/government related organizations, national or international research institutes or consortia, universities, academies of sciences, companies, national or international associations or federations of companies.

## Preface

The transformation process of the European energy system faces major challenges. Information technologies and computer systems are perceived as a key enabler for future sustainable production and consumption patterns. Multiple issues are awaiting clarification – besides technical and economic solutions, social and political as well as organizational and juridical aspects have to be considered. In particular, the complex and manifold interdependencies between involved technologies, numerous and internationally inconsistent regulations, and the lack of convincing business cases require attention. Furthermore, the ongoing transformation of the energy sector warrants consideration of both long-term solutions and concepts with perceptible short- to mid-term benefits.

New solutions are needed to maintain or even increase the reliability and the security of energy supply in more decentralized systems. Additionally, newly designed energy markets should enable an efficient and transparent matching of supply and demand for energy and ancillary services in large-scale networks. This requires the handling and analysis of great amounts of data as well as advanced algorithms for forecasting, operation, and matching, especially for distributed generation and consumption. The resulting overall system is thus going to be significantly more complex and interlinked. Considering these conditions, decentralized and autonomous agents may enable a robust high-performance system operation. Yet, the interactions between the market level and the technical system operation have to be dealt with carefully.

Although significant efforts and investments have already been made for developing smart grids and smart markets, important research questions need to be answered before smart grids become a reality. Particularly, sector coupling and hybrid energy infrastructures, considering not only electricity but also other grid-based energy carriers like natural gas and heat, become increasingly important. Additional flexibility and additional complexity are gained when these networks interact in order to meet the requirements of a decentralized, diversified, secured, sustainable, and stable future energy supply.

Regardless of how the energy system is designed and operated in the future, it is obvious that a key enabler for a successful transformation of the energy supply will be a purposefully designed and used ICT infrastructure. However, new solutions will consolidate and represent the combined knowledge of different disciplines such as engineering, business management, and economics as well as computer science. These new solutions will contribute significantly to an efficient energy supply and to the economic success of the companies involved. The IT backbone for such solutions is likely to comprise distributed, collaborative, autonomous and intelligent software packages for simulation, monitoring, control, and optimization as well as appropriate data and business models, reporting systems, and perhaps also mobile solutions.

The SmartER-Europe Conference aims at providing an interdisciplinary forum for presenting and discussing recent advances and experiences in building and using new

IT-based solutions for smart grids and smart markets. For this, the conference provides a forum for different scientific disciplines. Furthermore, it enables an industrially relevant exchange of knowledge and experience.

Both, SmartER Europe 2016 and 2017 were held in conjunction with “E-world energy & water” in Essen (Germany), which is one of the leading trade fairs for energy markets and energy management. The quality and practical relevance of the scientific contributions presented here were underlined by the participation of and discussion with industry; practical presentations of industrial projects rounded off the SmartER Europe program. The articles in this book were invited and reviewed after being selected from the conference presentations.

The contributions reflect the versatility and the complexity of the transformation process in the energy sector. At the same time, they also show the great need for research that is required to achieve the high targets for a digitized and sustainable energy landscape.

Special thanks go to the organizers of E-world energy & water, who have made possible the exchange between industry and science. Further, we would also like to take this opportunity to thank the members of the Steering and Program Committee, who were able to improve the quality of the contributions through their valuable advice.

## **Steering Committee**

Christoph Weber	University of Duisburg-Essen, Germany
Roland Broll	University of Duisburg-Essen, Germany
Gerald Blumberg	University of Duisburg-Essen, Germany
Christian Derksen	University of Duisburg-Essen, Germany

## **Program Committee**

Witold Abramowicz	Poznan University of Economics, Poland
Peter Birkner	University of Wuppertal, Germany
Christian Derksen	University of Duisburg-Essen, Germany
Maria Ganzha	University of Gdańsk, Germany
Stamatis Karnouskos	SAP, Germany
Christian Kreisler	TU Dortmund/LS EAM, Germany
Marcin Paprzycki	IBS PAN and WSM, Poland
Michael Sonnenschein	University of Oldenburg, Germany
Rainer Unland	University of Duisburg-Essen, Germany
Carsten Felden	University of Freiburg, Germany
Christoph Weber	University of Duisburg-Essen, Germany
Christoph Mayer	OFFIS e. V., Germany
Tobias Linnenberg	Helmut Schmidt University of Hamburg, Germany
Wolf Fichtner	Karlsruhe Institute of Technology, Germany
Joachim Schonowski	Deutsche Telekom AG, Germany

# Contents

## SmartER Europe 2016

Future Energy Systems – Autonomous Control, Self-sufficient Energy Infrastructures and Big Data . . . . .	3
<i>Peter Birkner</i>	
Digital Transformation Within the Emobility Market–Learnings and Insights from Early Market Development . . . . .	23
<i>Andreas Pfeiffer and Matthias Jarke</i>	
Future ICT-Infrastructure for Smart Grids: Potentials and Hurdles for a Co-operation Between the Energy and Telecommunication Sector . . . . .	43
<i>Daniel Schöllhorn, Daniel Iglhaut, Martin Waldburger, and Matthias Wissner</i>	
Self-detection of New Photovoltaic Power Plants Using a Low Voltage Smart Grid System . . . . .	56
<i>Philippe Steinbusch, Sebastian Fischer, Marcus Stötzel, Markus Zdrallek, and Nils Neusel-Lange</i>	
Dynamic Aggregation of Virtual Power Plants with a Registry System for Distributed Energy Resources . . . . .	65
<i>Tim Dethlefs, Thomas Preisler, and Wolfgang Renz</i>	
Understanding Distribution Grid Congestion Caused by Electricity Generation from Renewables . . . . .	78
<i>Hans Schermeyer, Michael Studer, Manuel Ruppert, and Wolf Fichtner</i>	
Wholesale Bidding Approaches of an Autonomous Trading Agent in Electricity Markets . . . . .	90
<i>Serkan Özdemir and Rainer Unland</i>	

## SmartER Europe 2017

Extending Energetic Potential of Data Centers to Participate in Smart Grid Networks . . . . .	107
<i>Alexander Borgerding and Sven Rosinger</i>	
Preparing Energy Providers’ Knowledge Base for Going Digital: Introduction of the EPOS Procedure . . . . .	121
<i>Fabian Reck, Michael Kolloch, and Alexander Fliaster</i>	

Open and Secure: Amending the Security of the BSI Smart Metering Infrastructure to Smart Home Applications via the Smart Meter Gateway . . . . 136  
*Christian Freudenmann, Dominik Henneke, Christian Kudera, Markus Kammerstetter, Lukasz Wisniewski, Christoph Raquet, Wolfgang Kastner, and Jürgen Jasperneite*
