HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

Stability Properties of Linear File-Sharing Networks

par **Florian Simatos**

File-sharing networks are distributed systems used to disseminate files among a subset of the nodes of the Internet. A file is split into several pieces called chunks, the general simple principle is that once a node of the system has retrieved a chunk, it may become a server for this chunk. A stochastic model is considered, and one investigates the conditions under which the Markov process describing this network is ergodic. Compared to classical stochastic networks, this model is difficult to analyze because the capacity of the system is a function of the state of the system and thus evolves randomly over time. Technical estimates related to the survival of interacting branching processes are key ingredients to establish the stability of these systems. In this talk I will present the simplest case that highlights these difficulties.
